

## PDEOZE PowerContainer

# Base station wind power supply charging current limit

Our Lifepo4 batteries can be connected in parallels and in series for larger capacity and voltage.

## Overview

---

Our product supports a DC input voltage range of 12V-78V with a maximum input current of 13A. You must ensure that the DC output from your wind turbine is stable and regulated, and that its specifications fall within the above-mentioned range. Failure to do so may cause damage to the product. What is the charge and discharging speed of a Bess battery?

The charging and discharging speed of a BESS is denoted by its C-rate, which relates the current to the battery's capacity. The C-rate is a critical factor influencing how quickly a battery can be charged or discharged without compromising its performance or lifespan.

How much power can a Bess generate?

The BESS can bid 30 MW and 119 MWh of its capacity directly into the market for energy arbitrage, while the rest is withheld for maintaining grid frequency during unexpected outages until other, slower generators can be brought online (AEMO 2018).

What is a 0.5c battery rate?

- 0.5C Rate: A 0.5C rate means the battery charges or discharges over two hours. A 10 MWh BESS at 0.5C provides 5 MW of power for two hours. This moderate rate suits applications like load leveling and peak shaving, where a steady energy output over a longer duration is advantageous.
