What is a distributed antenna system?

A Distributed Antenna System is a network of spatially separated antennas that work together to distribute a wireless signal throughout a building or geographic area. Unlike traditional single-antenna systems, DAS uses multiple smaller antennas connected to a central source to provide consistent coverage. How Does DAS Work?

.

What are the advantages of a distributed base station?

The distributed base station is cost-effective and enjoys high flexibility in installation (by changing the different combination of RU solutions) and thus, incurs much lower deployment costs.

What is 5G FR2 mmWave distributed base station?

Vicinity's 5G FR2 mmWave Distributed Base Station is an Intel X86 based base station solution that offers indoor and outdoor mmWave coverage to improve the system throughput or backhaul service.

Where is Das used?

DAS is commonly used in large indoor or outdoor spaces, such as office buildings, stadiums, campuses, airports, shopping malls, and other locations where conventional cell tower coverage and capacity might be insufficient.
