How long does it take to debug a 5G base station

Overview

Are 5G NR base stations 3GPP-compliant?

Every 5G NR base station or UE manufacturer must pass all the necessary tests before releasing the products to market. Otherwise, the products do not have 3GPP-compliant recognition and are not usable for network deployment. We start with a quick overview of 3GPP base station conformance testing requirements.

What is a 5G base station?

In a traditional distributed RAN (D-RAN) deployment, a 5G base station — called a gNodeB (gNB) — is a logical subsystem consisting of these components colocated on each cell tower: Advanced antenna system (AAS): These are the antennas that receive the modulated analog radio signals from user equipment (UE) like smartphones and IoT sensors.

How does a 5G core work?

The 5G core communicates with base station components (i.e., BBUs, CUs, or O-CUs) of the RAN over fiber networks. To test the core, the functions of the 5G base stations must be emulated. What is network slicing?

Network slicing is the dynamic allocation of 5G core functions and resources to suit specific applications.

What is a 5G baseband unit (BBU)?

It consists of fiber optic transmission infrastructure and protocols like the common public radio interface (CPRI). Baseband unit: The BBU is responsible for most of the signal processing, decoding, and preparing to send the data to the 5G core network.

What tests are performed during 5G measurements?

Introduction: The following tests are generally performed during 5G

measurements: Figure 1: Equipments available from Keysight Technologies for 5G measurements. References: Explore 5G measurements for User Equipment (UE) and Base Stations (BS), covering transmitter and receiver test scenarios, conformance, and network stability.

What are 5G UE and BS measurements?

This page provides an overview of 5G measurements performed on User Equipment (UE) and Base Stations (BS) or Nodes B (NB). It details both 5G UE measurements and 5G BS measurements. The 5G measurements encompass both transmitter and receiver test scenarios. Introduction: The following tests are generally performed during 5G measurements:
