Iceland New Energy Storage Company

Overview

Who is Icelandic New Energy Ltd?

Icelandic New Energy Ltd (Íslensk NýOrka ehf) is a company founded in 1999 following a decision in 1998 by the Icelandic Parliament to convert vehicles and fishing fleets to hydrogen produced from renewable energy by 2050.

Is Iceland a good place to store CO₂?

Known as the Land of Ice and Fire, Iceland is blessed with an abundance of geothermal energy. It also is mostly made of basalt rock, which turns out to be an ideal medium for storing CO₂. Climeworks marries Icelandic geology with what it says is cutting-edge technology for extracting CO₂ from the air and locking it underground.

Will Climeworks make Iceland a DAC & CO₂ storage hub?

Under the Bipartisan Infrastructure Law, the US has also agreed to provide companies with \$3.5 billion to scale DAC. A shadow over Climeworks' ambition to make Iceland a DAC and CO₂ storage hub is that the hot rocks providing the company with its geothermal energy also come with a threat.

Is Iceland a good place to build DAC?

With an abundance of geothermal energy, the potential for CO₂ storage, and a growing concentration of technical expertise, Iceland may well be the best place in the world for DAC. If the technology cannot prove its worth there, it may not be worth building anywhere.

Is Iceland a renewable country?

Iceland can claim such a high percentage of renewables, the most of any country in the world, thanks to its unique geology. Its land sits atop an incredibly active volcanic zone, and six major geothermal plants tap that subterranean warmth to provide heating for almost all the country's homes.

Are Iceland's native plants at risk of extinction?

Iceland's native plants are at risk of extinction as temperatures rise and invasive species arrive. One of the country's most important fish, the capelin, has occasionally vanished as waters around the country warmed. And like all coastal cities around the world, Iceland's capital, Reykjavik, is threatened by rising sea levels.
