In large-capacity three-phase inverters

Overview

Modular multilevel inverters (MMIs) for medium-voltage (MV) grid-connected systems are gaining attention in solar photovoltaic power (PV) applications. Existing MV power electronic converters require I.

How can a three-phase multilevel inverter reduce costs?

Using inverters with boosting capability and a low number of components to integrate renewable energy sources can reduce costs. This study describes a three-phase multilevel inverter based on extendable switching capacitors. The use of voltage-doubling modules permits the development of the inverter's capability.

Why do we need three-phase inverters?

In recent years due to the massive development in renewable energy-based power generation systems, three-phase inverters with boosting capability play a significant role in connecting low-voltage renewable energy sources like photovoltaic (PV) to the grid .

Is there a multi-variable energy function for a three-phase grid-following inverter?

Abstract—This work analytically establishes a multi-variable energy function for a three-phase grid-following inverter leveraging a unified equivalent-circuit model for its physical- and control-layer subsystems.

What is a compact three-phase multilevel inverter with reduced component count?

A compact three-phase multilevel inverter with reduced component count for low voltage application is proposed in . In this inverter, the number of components has been reduced, but three DC sources are used in its structure.

Can a three-phase multilevel inverter boost input voltage?

However, at low power, the amplitude of pulsed currents is low, and these inverters can be a good option due to special features such as reduced

component counts and voltage-boosting capability. This article presents an expendable three-phase multilevel inverter based on switched-capacitor cells which can boost the input voltage.

Can a three-phase inverter reduce the number of power switches?

Additionally, a comparative analysis is provided; highlighting the advantage of reducing the number of power switches in the proposed three-phase inverter compared to other existing topologies. Finally, a laboratory prototype is developed, operating at a 4 kHz switching frequency and with a 120 V DC-link voltage.
