Overview

By integrating solar, wind, and battery storage, microgrids ensure energy access. They also support resilience against climate impacts. This article explores microgrids' principles and applications. How can rural areas contribute to a broader energy network?

Beyond producing energy for local consumption, rural areas can contribute significantly to broader energy networks. The energy generated in these areas can be transported to urban centres and integrated into larger grids for electricity and heat production (Gaiser and Stroeve, 2014; Raimondi et al., 2024).

Are hybrid solar and wind power systems a good idea in Spain?

In rural Spain, hybrid solar and wind power systems have significantly reduced energy costs and increased energy independence (Quirapas Franco and Tæihagh, 2024). The European Commission estimates that by 2030, citizen-led energy communities could own up to 17% of wind and 21% of solar power (Raimondi et al., 2024).

Can solar energy be integrated into modular cold storage systems?

Recent innovations in renewable energy technology, energy storage systems, and smart energy management have paved the way for the integration of advanced solar, wind, and thermal energy into modular cold storage systems designed specifically for rural applications (Alam et al., 2022).

What are the different types of rural energy communities?

Types of rural energy communities The rural energy communities, identified in 68 articles, are grouped in 2 types: Renewable Energy Communities (RECs): 27 articles (Fig. 2 (b)) focus on communities using renewable energy sources, e.g., biomass (48%), solar (44%), wind (15%), and geothermal (7%).

What are the environmental benefits of a rural energy system?

Therefore, it is essential to consider the carbon emissions of the system as environmental benefits. Additionally, traditional rural energy sources tend to have low energy efficiency, which can be significantly improved by implementing an MECS.

What are the benefits of solar and wind energy?

The utilization of solar and wind energy reduces the consumption of biomass energy and electricity purchased from the public grid, leading to an increase in primary energy savings rate. Furthermore, biogas engines and the public grid are major contributors to carbon emissions growth in the MECS.
