How do I choose a lithium-ion battery pack?

When selecting a lithium-ion battery pack, understanding its voltage characteristics is crucial for ensuring optimal performance and longevity. Three key voltage terms define a battery's operation: Nominal Voltage, Charged Voltage, and Cut-Off Voltage.

What is the best storage voltage for a lithium ion battery?

The best storage voltage for lithium titanate oxide (LTO) cells is between 2.4V and 2.5V per cell, and for lead acid batteries, it's around 2 volts per cell or 12 volts for a typical battery. Ideally, you should have a designated area that you use solely for lithium-ion battery storage.

What voltage does a lithium ion battery discharge?

For most lithium-ion batteries, 12V models typically discharge to around 10.0V to 10.5V, 24V batteries drop to approximately 20.0V to 21.0V, and 48V batteries reach around 40.0V to 42.0V. At What Voltage Is a Lithium-Ion Battery Considered Dead?

A lithium-ion battery is considered fully discharged or “dead” when it reaches the cut-off voltage.

How do I choose a battery pack?

Understanding nominal, charged, and cut-off voltages is essential when choosing a battery pack for your application. Nominal voltage defines the battery's general operating range, charged voltage determines its full power capacity, and cut-off voltage ensures safe discharge limits.

What is a lithium ion battery voltage?

When working with lithium-ion batteries, you'll come across several voltage-related terms. Let's explain them: Nominal Voltage: This is the battery's

“advertised” voltage. For a single lithium-ion cell, it’s typically 3.6V or 3.7V.  
Open Circuit Voltage: This is the voltage when the battery isn’t connected to anything.

How does a lithium ion battery charge?

During charging, lithium-ion batteries exhibit distinct voltage characteristics that reflect their electrochemical processes. The charging cycle typically follows a constant current-constant voltage (CC-CV) protocol. Initially, the battery voltage rises steadily as current flows into the cell.

Tips For Properly Storing Lithium Ion Batteries  
Best Storage Voltage For LFP  
Best Storage Voltage For NMC  
Best Storage Voltage For LTO  
Best Storage Voltage For Lead Acid  
Best Storage Voltage For Nimh  
Now that you know that a lithium-ion battery needs to be stored at about 40% of its maximum capacity, we can do a little math to find out the best storage voltage for LFP cells. LiFePo4 cells have a max charge voltage of 3.65 volts. Whatever you do, don't do this:  $3.65 \text{ volts} \times 0.40 = 1.46 \text{ volts}$  Because doing that assumes that the voltage curve is | See more on [cellsaviors nexusbattery](#) systems
