What is an on-grid solar inverter?

1. On-Grid Solar Inverter An on-grid solar inverter connects directly to the utility grid. It synchronizes the solar system with grid electricity and exports excess energy. On-grid systems are cost-effective. They reduce electricity bills and enable net metering, where users get credited for the energy they supply to the grid.

What is an off-grid inverter?

Though fundamentally an off-grid inverter, this versatile model features grid input support—allowing it to draw power from the grid when solar and battery resources are insufficient. Commonly known as an off-grid hybrid inverter, it combines solar + battery + optional grid power, ensuring uninterrupted energy supply.

Are on-grid inverters cost-effective?

On-grid systems are cost-effective. They reduce electricity bills and enable net metering, where users get credited for the energy they supply to the grid. This setup is ideal for urban areas with stable grid access. On-grid inverters cannot function during power outages because they rely on the grid.

Can a grid tie inverter be used as an off-grid?

Sometimes, an on-grid inverter can be used directly as an off-grid inverter. The grid tie inverter sends energy directly to the grid, so the frequency and phase of the grid must be tracked. It is equivalent to a current source. Of course, there are also some inverters that have low-voltage ride-through capability and can be used for PQ adjustment.

What is the difference between hybrid and off-grid inverters?

Off-grid and hybrid systems need additional components, making their installation more complex. On-grid inverters are best for urban areas with

stable power supply. Off-grid inverters suit rural or remote locations without grid access. Hybrid inverters are ideal for users seeking both flexibility and backup power.

How do I install an on-grid inverter?

Installing an on-grid inverter is generally simple for residential use. The process involves mounting the unit near the main panel, connecting it to the solar array and the grid, and setting up monitoring. On-grid systems are also more cost-effective, typically costing 40–50% less than off-grid setups due to the lack of battery storage.
