Telecom Base Station Power Supply Safety Standards

Overview

What is always on telecommunications equipment?

This is always-on, on-premises telecommunications equipment developed by the NTT Group and installed at the customer's building or other customer premises. Examples include the optical network unit (ONU) or home gateway (HGW). This is a power source that supplies external power to telecommunications equipment. A typical example is an AC adapter.

What are the NFPA requirements for stationary fuel cell power plants?

The IFC directs permit applicants to two National Fire Protection Agency (NFPA) documents that contain requirements specifically applicable to stationary fuel cell power plants: NFPA 853 refers to the National Electric Code for area classification requirements as well as Article 692, which sets electrical safety requirements for fuel cells.

What types of power systems are used in communications infrastructure equipment?

Communications infrastructure equipment employs a variety of power system components. Power factor corrected (PFC) AC/DC power supplies with load sharing and redundancy (N+1) at the front-end feed dense, high efficiency DC/DC modules and point-of-load converters on the back-end.

What is a preferred power supply architecture for DSL applications?

A preferred power supply architecture for DSL applications is illustrated in Fig. 2. A push-pull converter is used to convert the 48V input voltage to +/-12V and to provide electrical isolation. Synchronous buck converters powered off of the +12V rail generate various low-voltage outputs.

What is the Protection coordination for rated power of external power supplies?

The protection coordination for rated power of external power supplies and

rated power consumption of on-premises telecommunications equipment The rated power of an external power supply shall be at least the rated power consumption of the on-premises telecommunications equipment.

How does the Department of energy help telecommunication sites with fuel cell backup power?

To support efficient permitting and safe operations at telecommunication sites that use fuel cell backup power, the U.S. Department of Energy works with codes organizations, local permitting officials, national laboratories, and industry experts to develop model codes and standards and to provide up-to-date information for everyone involved.
