# The difference between solar panels for home use and power station use

## Overview

---

What is the difference between a portable power station and a solar generator?

The primary distinction lies in how they handle energy. Portable power stations (PPS) store energy, while solar generators generate energy by converting sunlight through solar panels. However, if you pair a portable power station with solar panels, you essentially create a solar generator setup.

Are solar panels better than a portable power station?

Due to the necessary addition of solar panels, generators tend to be a little heavier and larger than PPS systems. However, portability varies significantly. A smaller model with solar panels will still be lighter than a more heavy-duty portable power station.

How does a solar generator work?

Solar generators function similarly to portable power stations, with one key distinction—they generate their own energy. While a portable power station (PPS) only stores electricity, a solar generator actively produces power using solar panels. Solar generators also use rechargeable batteries to store and provide energy when needed.

Should you buy a power station or a solar generator?

They're popular not only among campers and travelers but homeowners buy them as well to have an emergency solution in case the power goes out. One popular misconception when it comes to power stations/solar generators is that they can recharge themselves with the help of the sun. This is not true.

What is a solar powered generator?

EcoFlow solar generators are designed to be just as portable as traditional power stations. For example, the EcoFlow DELTA Mini + 110W solar panel

combines the energy-storing unit with a lightweight, portable solar panel for on-the-go power generation. How Does a Solar Powered Generator Work?

.

Does a solar generator need an inverter?

A common feature on a solar generator is AC outlets. These outlets look like the wall outlets found in a home and can power 120V electronics. Since the battery is often wired in a 12V configuration, the power station needs a way to change that 12V DC battery power to 110/120V AC power. This is what the inverter does.
