What are bifacial double-glass modules

Overview

Are double glass modules bifacial?

Dual-sided energy Capture: Many double glass modules are bifacial, allowing them to harness sunlight from both sides. This can lead to energy gains of up to 25%, especially when installed over reflective surfaces.

Should bifacial panels have double/dual glass?

These days, many bifacial panel designs incorporate double/dual glass at the rear of the modules. Glass-glass panels seem to better transmit light and are more resistant to unpredictable weather, moisture, corrosion, and have good mechanical load capacity.

Why are double glass solar panels bifacial?

Thermal stability: The identical thermal expansion coefficients of the glass layers minimize stress on solar cells during temperature fluctuations. Dual-sided energy Capture: Many double glass modules are bifacial, allowing them to harness sunlight from both sides.

What is bifacial glass technology?

Bifacial glass technology is the preferred material among manufacturers for the rear side cover of the modules. Some key advantages of the glass-glass structure are: Glass-glass modules can also be frameless, which helps eliminate the cost of an extruded aluminum frame. However, glass-glass models with frames have a lower risk of breakage.

What is a bifacial solar module?

The front of a bifacial solar module is covered with a protective glass and the rear side may be made of either glass or transparent polymer backsheet that allows sunlight to pass through. This stands in contrast to conventional solar panels which have opaque backsheets.

Why are glass-glass bifacial modules becoming more popular?

Due to their better reliability, glass-glass bifacial configurations have a larger portion of the worldwide bifacial module market share. Glass shortages, weight concerns for larger format modules, and decreasing prices for transparent backsheets have caused some manufacturers to switch to a glass-transparent backsheet structure.

Oct 14, 2025 · Dual-glass type modules (also called double glass or glass-glass) are made up of two glass surfaces, on the front and on the rear with a thickness of 2.0 mm each.
