# What is the reference quantity of the grid-connected inverter

## Overview

Grid-tie inverters convert DC electrical power into AC power suitable for injecting into the electric utility company grid. The grid tie inverter (GTI) must match the phase of the grid and maintain the output voltage slightly higher than the grid voltage at any instant. A high-quality modern grid-tie inverter has a fixed unity , which means its output voltage and current are perfectly lined up, and its phase angle is within  $1^\circ$  of the AC power grid. The inverter has an internal com.

The control design of this type of inverter may be challenging as several algorithms are required to run the inverter. This reference design uses the C2000 microcontroller (MCU) family of devices to implement control of a grid connected inverter with output current control.

This reference design implements single-phase inverter (DC/AC) control using a C2000™ microcontroller (MCU). The design supports two modes of operation for the inverter: a voltage source mode using an output LC filter, and a grid connected mode with an output LCL filter. High-efficiency, low THD.

A grid-tie inverter converts direct current (DC) into an alternating current (AC) suitable for injecting into an electrical power grid, at the same voltage and frequency of that power grid. Grid-tie inverters are used between local electrical power generators: solar panel, wind turbine.

The grid-connected system consists of a solar photovoltaic array mounted on a racking system (such as a roof-mount, pole mount, or ground mount), connected to a combiner box, and a string inverter. The inverter converts the DC electrical current produced by the solar array, to AC electrical current.

There are two main requirements for solar inverter systems: harvest available energy from the PV panel and inject a sinusoidal current into the grid in phase with the grid voltage. In order to harvest the energy out of the PV panel, a

Maximum Power Point Tracking (MPPT) algorithm is required. This.

For full compliance to IEEE 1547-2018 and IEEE 1547.1-2020 GW.2.0 or SMC shall be used with Solar Inverter. The following specifications reflect Tesla Solar Inverter with Site Controller (Tesla P/N 1538000-45-y). For specifications on Tesla Solar Inverter without Site Controller, see Tesla Solar.

Growatt grid-tied inverters are named based on their rated AC output power. For example, the MID\_15-25KTL3-X corresponds to a rated AC output power of 15-25KW. The "T" stands for "Three," indicating it is a three-phase inverter. This refers to the maximum DC power that the inverter can handle from.
