In this section, a novel Energy Storage System Based on Hybrid Wind and Photovoltaic Technologies technique is developed for a sustainable hybrid wind and photovoltaic storage system. Hybrid solar PV and wind frameworks, as well as a battery bank connected to an air conditioner Microgrid, are displayed in Fig. 2 show the overall proposed model. The.

Clean energy sources like wind and solar have a huge potential to lessen reliance on fossil fuels. Due to the stochastic nature of various energy sources, dependable hybrid systems have recently been developed. This paper's major goal is to use the existing wind and solar resources to provide electricity. A 6 kWp solar-wind hybrid system installed on the roof of an educational building is studied and optimized using HOMER (Hybrid Optimization of Multiple Energy Resources) software at different levels of reliability. At an average annual Cost of Energy (COE) of \$1.156 per kWh, the system generates 1996 kWh of power overall. Investigations are made on the techno-economic characteristics of real and ideal hybrid system topologies with maximum capacity shortfalls of 0 %, 5 %, 10 %, and 20 %. T.

The expected amount of power generated globally in 2015 was 22,433 Terawatt-hours (TWh). 13,659 TWh of the energy came from traditional fossil fuel-based power plants, which made up the majority of the contribution. In contrast, hydropower-exempt Renewable Energy Systems (RESs) made up just 1570.31 TWh [1]. Governments and international environmental organizations have provided incentives to support the market for renewable energy [2,3]. Inadvertently causing global warming is the greenhouse effect, which is fuelled by CO₂ emissions from coal-fired power plants. To combat the dangerous effects of global warming, it is thus important to transition to a clean, non-polluting electricity system [4]. Fig. 1 displays the split of RESs that have been deployed internationally. Unfortunately, th.

In recent days, researchers have introduced several methods, specifically developed for sustainable hybrid wind and photovoltaic storage systems. Some of the strategies are covered briefly in this section.In 2020 Hou, H., et

al. [18] suggested an Optimal capacity configuration of the wind-photovoltaic-storage hybrid power system based on gravity energy storage system. A new energy storage technology combining gravity, solar, and wind energy storage. The reciprocal nature of wind and sun, the ill-fated pace of electricity supply, and the pace of commitment of wind-solar hybrid power systems. In this evaluation, the model is charged under his two assumptions of constant energy costs and seasonal energy values using the Feline.
